UK-MG Ammo																
Description: Ammo Bins contain the rounds needed for projectile-based weaponry, with at least one bin required per weapon type. Most Ammo Bins will explode and destroy their installed location when they receive a Critical Hit, however Ultra-Kinetic Machine Gun ammunition is made up of solid high-tech metal alloy metals engineered to have a custom-structured atomic structure, thanks to an open-standard technology developed and by Westonmach. This solid alloy material makes up all of the rounds, and there is no casing, gunpowder, or chemical components, explosive or otherwise. As such, there isn't any part of the ammunition to explode or burn if the ammunition or it's storage container gets damaged or even set on fire in combat, so no explosion will occur from a critical hit.\n\n Ultra-Kinetic Machine Gun Ammo Bins may feed multiple weapons, which do not have to be installed in the same location, thanks to a battlemech's internal mechanisms which feed and transfer ammunition around inside of a battlemech's parts, like any other ammunition bins.\n\n Westonmach ammunition bins use magical extradimensional technology to fit their ammunition into a space smaller than the total cubic area of all of the ammunition itself. In Battlemechs, this comes at the cost of weakened total armor for the battlemech, because of the magistics that apply, however the smallest capacity ammunition box of it's type usually does not incur any such tradeoff. Also, larger capacity ammunition bins will impair the battlemech's cooling capabilities, resulting in a small to moderate reduction in the overheating threshold and also the maximum amount of heat the battlemech can take.

Rocket, Deathfire																
Description: Ammo Bins contain the rounds needed for projectile-based weaponry, with at least one bin required per weapon type. Most Ammo Bins will explode and destroy their installed location when they receive a Critical Hit. Deathfire Rocket Ammunition Bins may feed multiple weapons, which do not have to be installed in the same location as each other or the ammunition bin, thanks to a battlemech's internal mechanisms that transfer ammunition around inside arms, legs, torso parts, etc.\n\n Deathfire rockets are a bit bigger than SRM and LRM missiles, and their launchers of higher levels can take up more space than typical LRM and SRM launchers. Deathfire rockets use magical technology in that the rockets will have characteristics determined by the launching units, such as damage dealt, maximum range, etc., that will vary depending on the launcher's type and level.\n\n Westonmach ammunition bins use magical extradimensional technology to fit their ammunition into a space smaller than the total cubic area of all of the ammunition itself. In Battlemechs, this comes at the cost of weakened total armor for the battlemech, because of the magics that apply, however the smallest capacity ammunition box of it's type usually does not incur any such tradeoff. Also, larger capacity ammunition bins will impair the battlemech's cooling capabilities, resulting in a small to moderate reduction in the overheating threshold and also the maximum amount of heat the battlemech can take.

Reaper Auto Cannon Ammo

Description: Ammo Bins contain the rounds needed for projectile-based weaponry, with at least one bin required per weapon type. Most Ammo Bins will explode and destroy their installed location when they receive a Critical Hit, including Reaper Auto Cannon ammunition, which have warheads that can be made to explode under certain conditions. Aside from the warhead, a Reaper Auto Cannon round is made up of solid high-tech metal alloy metals engineered to have a custom-structured atomic structure, thanks to an open-standard technology developed and by Westomach. The rounds do not leave any shell or casing behind after firing, and do not use gunpowder or out-dated archaic technology to propel the round through and out of the barrel, but use alternative technology.\n\n Reaper Auto Cannon Ammo Bins may feed multiple weapons, which do not have to be installed in the same location, thanks to a battlemech's internal mechanisms which feed and transfer ammunition around inside of a battlemech's parts, like any other ammunition bins.\n\n Westomach weapon ammunition bins use magical extradimensional technology to fit their ammunition into a space smaller than the total cubic area of all of the ammunition itself. In Battletechs, this comes at the cost of weakened total armor for the battlemech, because of the magics that apply, however the smallest capacity ammunition box of it's type usually does not incur any such tradeoff. Also, larger capacity ammunition bins will impair the battlemech's cooling capabilities, resulting in a small to moderate reduction in the overheating threshold and also the maximum amount of heat the battlemech can take.

Wastemaker Auto Cannon Ammo

Description: Ammo Bins contain the rounds needed for projectile-based weaponry, with at least one bin required per weapon type. Most Ammo Bins will explode and destroy their installed location when they receive a Critical Hit, although Wastemaker Cannon ammunition is completely made up of a shaped slug, with no casing, no warhead, and no chemical or explosive propellant of any kind as it relies on the cannon shooting it to propel it through the air. As such, it will not explode while inside of an ammunition bin that gets hit or damaged, and is therefore not a fire or explosion hazard. Wastemaker rounds differ from Reaper Auto Cannon rounds in these ways, as well as the rounds and the guns that fire them being smaller. Wastemaker rounds are made of solid high-tech metal alloy metals engineered to have a custom-structured atomic structure, thanks to an open-standard technology developed and by Westomach. Wastemaker Auto Cannon rounds use a technology other than archaic methods involving gunpowder, etc., to propel the rounds.\n\n Wastemaker Auto Cannon Ammo Bins may feed multiple weapons, which do not have to be installed in the same location, thanks to a battlemech's internal mechanisms which feed and transfer ammunition around inside of a battlemech's parts, like any other ammunition bins.\n\n Westomach weapon ammunition bins use magical extradimensional technology to fit their ammunition into a space smaller than the total cubic area of all of the ammunition itself. In Battletechs, this comes at the cost of weakened total armor for the battlemech, because of the magics that apply, however the smallest capacity ammunition box of it's type usually does not incur any such tradeoff. Also, larger capacity ammunition bins will impair the battlemech's cooling capabilities, resulting in a small to moderate reduction in the overheating threshold and also the maximum amount of heat the battlemech can take.
